II. Summary of 2004 Enterovirus Season

In 2004, the Michigan Department of Community Health (MDCH) Bureau of Laboratories reported fewer positive enterovirus isolates than in previous years. The laboratory received 82 samples for testing from throughout the state of Michigan. This number is down from the previous 2 years and noticeably down from 2001. In 2001, the lab received 220 samples for enterovirus isolation and 103 in both 2002 and 2003. Of the 82 samples received this year, enteroviruses were isolated and identified from 17. The age distribution on these 17 confirmed cases was from 1 day old to 40 years. For a summary of enterovirus types isolated by geographic region, see below.

III. Summary of Enterovirus Data by Geographic Location

The data shown here are the results obtained by the MDCH Viral Isolation Laboratory from submitted isolates plus enterovirus isolates recovered from clinical specimens submitted by agencies or physicians in the state.

Data for the year of 2004.

This season, the MDCH lab received 82 specimens for enterovirus isolation/typing, some of which grew no virus.

To determine your county's Health Region, see the link at the bottom of this page.

Health Region	Cox A16	Cox B4	Cox B5	Echo 4	Echo 9	Echo 18	Comments
Southeast	2	1					
Southwest					1	1	
Central			3	1	8		
Northern							No Enteroviruses Detected
